$$[IX] \xrightarrow{SO_2Cl_2} Cl - C - O - CH_2 - C - CH_2 - O - CH_2 - CH_2 - O - CH_2 - CH_2 - O - CH_2 - O$$

wherein R and R" are as defined above.

The carbonates of this invention are useful as energetic additives to propellants and explosive.

1 Claim, No Drawings

UNSYMMETRICAL POLYNITROCARBONATES AND SYMMETRICAL 1,3-BIS(HALO- AND NITROALKYL

CARBONYLDIOXY)-2,2-DINITROPROPANES AND METHODS OF PREPARATION

This is a division of U.S. Pat. No. 4.332,744 entitled. Preparation." which issued to William H. Gilligan and Scott L. Stafford on June 1, 1982.

BACKGROUND OF THE INVENTION

This invention relates to organic carbonates and more 15 particularly to nitro substituted organic carbonates.

In order to prepare unsymmetrical carbonates, it is necessary to react a chloroformate of an alcohol with a second alcohol. The general method for preparing chloroformates is to react an alcohol with an excess of phosgene (poisonous gas) in the presence of a base as an acid acceptor. Inevitably a greater or lesser amount of the carbonate is formed, as a by-product, which lowers the vield and requires separation of the product. In addi- 25 tion, nitroalcohols in the presence of base, have a tendency to deformylate, which also lowers the vield of chloroformate. A third factor is that nitro substituted diols such as 2.2-dinitropropan-1,3-diol form as major products linear carbonates and cyclic carbonates.

SUMMARY OF THE INVENTION

An object of this invention is to provide new organic compounds.

Another object of this invention is to provide new explosive materials.

A further object of this invention is to provide unsymmetrical polynitrocarbonates.

Still another object is to provide a method of synthe- 40 sizing unsymmetrical polynitrocarbonates.

Yet a further object of this invention is to provide novel symmetrical 1.3-bis(halo- and nitroalkyl carbonyldioxy)-2.2-dinitropropanes.

Still a further object of this invention is to provide a method of synthesizing novel symmetrical 1.3-bis(haloand nitroalkyl carbonyldioxy)-2.2-dinitropropanes.

These and other objects of this invention are achieved by providing (1) novel unsymmetrical polyni- 50 trocarbonates of the formula

by the following reaction sequence

ROH - CI-C-S-R'
$$\xrightarrow{\text{Ericdistalls}}$$
 RO-C-SR"

[III] $\xrightarrow{\text{IIII}}$ $\xrightarrow{\text{IIV}}$ $\xrightarrow{\text{RO-C-CI}}$ $\xrightarrow{\text{IIV}}$

-continued
$$[V] + R \cdot OH \xrightarrow{base} R - O - C - O - R'$$

$$[VI] \qquad [I]$$

wherein R ≠ R' and wherein R and R' are each selected from the group consisting of -CH₂C(NO₂)₃, "Unsymmetrical Polynitrocarbonates and Methods of 10 CH₂CF(NO₂)₂, —CH₂CF₂(NO₂), —CH₂CCl(NO₂)₂, $--CH_2CF_3, \quad --CH_2CCl_3, \quad --CH_2C(NO_2)_2CH_3, \quad \text{and} \quad$ -CH2CF2CF2H, and wherein R" is a lower alkyl of from 1 to 6 carbon atoms;

> and (2)symmetrical 1,3-bis(halo-and nitroalkyl carbonyldioxy)-2,2-dinitropropane of the formula

which are synthesized the following reaction sequence

$$[1X] \xrightarrow{SO_2Cl_2} Cl - C - O - CH_2 - C - CH_2 - O - C - Cl$$

$$[X] \xrightarrow{SO_2Cl_2} cl - C - O - CH_2 - C - CH_2 - O - C - Cl$$

$$[X]$$

$$[N] - 2ROH \xrightarrow{base} RO - C - O - CH_2 - C - CH_2O - C - OR$$

$$[N] | VIII | C | C - CH_2O - C - OR$$

wherein R and R" are as defined above.

The carbonates of this invention are useful as ener-55 getic additives to propellants and explosives.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

The reaction sequences of this invention summarized as follows:

STEP	UNSYMMETRICAL	SYMMETERICAL
	ROH	NO:
	0	носи ^т сси ^з он Т
	∬ R″SCCl	NO ₂

-con	tir	111	œ ሮ

	Continu		
STEP	UNSYMMETRICAL	SYMMETERICAL	_
(1)	Friedi- Crafts Catalyst	Preidl-	5,
	o ROCSR"	Crafts Catalyst	10
	1	O NO2 O R″SCOCH2CCH2OCSR″ NO2	15
(2)	\$O ₂ Cl ₂	SO ₂ Cl ₂ reflux O NO ₂ O CICOCH ₂ CCH ₂ OCCI NO ₂	20
(3)	R'OH basc O II ROCOR	2ROH base O NO2 O ROCOCH2CCH2OCOR	25
		NO ₂	_ 30

wherein $R \neq R'$ and R and R' can be $-CH_2C(NO_2)$ - $_3$,— $CH_2CF(NO_2)_2$,— $CH_2CF_2(NO_2)$,— CH_2CCI $(NO_2)_2$, — CH_2CF_3 , — CH_2CCI_3 , — $CH_2C(NO_2)_2CH_3$. and -CH2CF2CF2H, and wherein R" is a lower alkyl 35 group of from 1 to 6 carbon atoms, but preferably a lower alkyl of from 1 to 3 carbon atoms.

The alcohols ROH and R'OH, which may be used in the synthesis are

- 2.2.2-trinitroethanol,
- 2-fluoro-2,2-dinitroethanol,
- 2,2-difluoro-2-nitroethanol,
- 2-chloro-2.2-dinitroethanol.
- 2,2.2-trifluoroethanol.
- 2.2.2-trichloroethanol.
- 2.2-dinitropropanol, and
- 2.2.3.3-tetrafluoropropanol.

Obviously, for unsymmetrical carbonates ROH must not be the same as R'OH. Note that the alcohol used in 50 2-fluoro-2,2-dinitroethyl chloroformate. step (1) for the production of symmetrical 1.3-bis(halo and nitroalkyl carbonyldioxy)2,2-dinitropropanes is 2.2-dinitropropan-1.3-diol.

The syntheses of the unsymmetrical and the symmetrical carbonates differ in the combination of alcohols 55 2.2-dinitropropyl chloroformate, and used, but the same reaction conditions are used.

The solvents used in all reaction steps must be inert. Examples of suitable solvents are methylene chloride, chloroform. 1.2-dichloroethane, and benzene

In step (1) a Friedl-Crafts catalyst was used in a non- 60 basic solution. Examples of suitable catalysts are ferric chloride, stannic chloride, titanium tetrachloride, and zinc chloride. Anhydrous ferric chloride was used in the example 1-9.

tween the alcohol and the alkyl chlorothioformate is vigorous at ambient temperature in the presence of the catalyst (anhydrous FeCla). The reaction mixtures were

stirred at ambient temperature for 30 to 60 minutes and yields of 90 percent or more were obtained.

The general formulas of the products of step (1) are

for the unsymmetrical synthesis and

5 for the symmetrical synthesis. Because of the commercial availability of S-ethyl chlorothiolformate, the following products should be easiest to produce

S-ethyl 2,2,2-trinitroethyl thiolcarbonate.

S-ethyl 2-fluoro-2.2-dinitroethyl thiolcarbonate

20 S-ethyl 2.2-fluoro-2-nitroethyl thiolcarbonate,

S-ethyl 2-chloro-2.2-dinitroethyl thiolcarbonate.

S-ethyl 2.2,2-trifluoroethyl thiolcarbonate,

S-ethyl 2.2.2-trichloroethyl thiolcarbonate.

S-ethyl 2,2-dinitropropyl thiolcarbonate.

25 S-ethyl 2.2.3,3-tetrafluoropropyl thiolcarbonate. and finally the

Bis(S-ethyl thiolcarbonate) of 2.2-dinitropropan-1.3-

In step (2) the alkyl thiolcarbonate is refluxed with an excess of sulfuryl chloride (SO2Cl2) in an inert solvent until the alkyl thiolcarbonate is converted to the corresponding chloroformate. In Examples 4, 5, and 6, six hours of refluxing produced the products in good yield.

For reaction step (2) the general formula for the product of the unsymmetrical process is

wherein R is as defined above. More specifically the compounds are

2.2.2-trinitroethyl chloroformate.

45

2.2-difluoro-2-nitroethyl chloroformate.

2-chloro-2,2-dinitroethyl chloroformate.

2.2.2-trifluoroethyl chloroformate.

2.2.2-trichloroethyl chloroformate.

2.2.3.3-tetrafluoropropyl chloroformate.

The product of the symmetrical process is

In step (3) the chloroformate is reacted with an alco-Examples 1, 2, and 3 illustrate that the reaction be- 65 hol to produce the product carbonate. As illustrated by examples 7, 8, and 9, the reaction mixture should be cooled and the addition rate of the alcohol to the chloreformate should be adjusted so that the reaction mix10

35

ture does not overheat. A base, such as pyridine, is added to the mixture to act as an acid acceptor for the HCl generated by the reaction.

In the case of the unsymmetrical synthesis the general reaction of step (3) is

$$\begin{array}{ccc}
O & O \\
\parallel & \parallel \\
R'OCOR + HC
\end{array}$$

wherein R and R' are as defined above and $R \neq R'$. Preferred carbonates include

- 2-fluoro-2.2-dinitroethyl-3.3.3-trinitroethylcarbonate 2,2-difluoro-2-nitroethyl-3.3.3-trinitroethylcarbonate.
- 2-chloro-2-dinitroethyl-3.3,3-trinitroethylcarbonate.
- 2,2-dinitropropyl-3.3.3-trinitroethylcarbonate, 2,2-difluoro-2-nitroethyl-3-fluoro-3,3-dinitroethylcar-
- bonate. 2-chloro-2.2-dinitroethyl-3-fluoro-3,3-dinitroethylcar-
- bonate,
- 2.2-dinitropropyl-3-fluoro-3,3-dinitroethylcarbonate.2-chloro-2.2-dinitroethyl-3,3-difluoro-3-nitroethylcarbonate.
- 2.2-dinitropropyl-3.3-difluoro-3-nitroethylcarbonate and
- 2,2-dinitropropyl-3-chloro-3,3-dinitroethylcarbonate.

 The general reaction of step (3) for the symmetrical 1,3-bis (halo- and nitroalkyl carbonyldioxy)-2,2-dinitropropanes synthesis is

wherein R is as defined above. Specifically the symmetrical 1.3-bis(halo- and nitroalkyl carbonyldioxy)-2.2-dinitropropanes are

- 1.3-bis(3.3.3-trinitroethyl carbonyldioxy)-2.2- dinitropropane.
- 1.3-bis(3-fluoro-3,3-dinitroethyl carbonyldioxy)-2,2-dinitropropane.
- 1.3-bis(3.3-diffuoro-3-nitroethyl carbonyldioxy)-2.2-dinitropropane.
- 1.3-bis(3-chloro-3.3-dinitroethyl carbonyldioxy)-2.2- 50 dinitropropane.
- 1.3-bis(3.3.3-trifluoroethyl carbonyldioxy)-2.2-dinitropropane.
- 1.3-bis(3,3.3-trichloroethyl carbonyldioxy)-2.2-dinitro-
- 1,3-bis(3.3-dinitropropyl carbonyldioxy)-2,2-dinitropropane, and
- 1,3-bis(3,3,4,4-tetrafluoropropyl carbonyldioxy)-2,2-dinitropropane.

The three step process used to synthesis the unsymmetrical carbonates of this invention, may be used to synthesis a wide variety of unsymmetrical carbonates. However, the alcohol used in step (1) to prepare the S-alkyl thiolformate should have at least one electronegative substituent, such as NO₂, F, etc. The presence of the substituent inhibits chlorination of the functional group, which otherwise would give rise to side-products.

The general nature of the invention having been set forth, the following examples are presented as specific illustrations thereof. It will be understood that the invention is not limited to these examples but is susceptible to various modifications that will be recognized by one of ordinary skill in the art.

EXAMPLE 1

S-ethyl 2,2,2-trinitroethyl thiolcarbonate

To a stirred solution of 9.2 g of 2.2.2-trinitroethanol in 10 ml of 1.2-dichloroethane was added 6.5 ml of ethyl chlorothiolformate and one ml of a 50% anhydrous ferric chloride solution in nitromethane. A vigorous reaction immediately ensued. The solution was stirred 20 for one hour and then taken up in methylene chloride and washed consecutively with dilute hydrochloric acid and five 60 ml portions of water. After drying with anhydrous magnesium sulfate, the organic solution was filtered and the solvents removed in vacuo. The residue 25 was crystallized from chloroform/hexane solution to give 12.52 g (90%) of the title compound: m.p. 36°. H—NMR (acetone d_o): δ=5.96 (S, 2H—CH₂C(NO₂)₃), 2.93 (q, 2H,—SCH₂—), 1.28 (t, 3H,—CH₃).

Cale for C₅H₇N₃O₆S: C, 22.31, H. 2.62; N, 15.61; S, 30 11.91. Found: C, 22.19; H, 2.57; N, 15.30; S, 11.65.

EXAMPLE 2

S-ethyl 2-fluoro-2.2-dinitroethyl thiocarbonate

To a stirred solution of 7.7 g (0.05 mol) fluorodinitroe-thanol in 10 ml of methylene chloride was added 6.5 ml of ethyl chlorothiolformate and one ml of a 50% ferric chloride solution in nitromethane. A vigorous reaction immediately ensued that was essentially over in a few minutes. To insure complete reaction, stirring was continued for 30 minutes. The reaction mixture was taken up in methylene chloride and washed consecutively with 100 ml of dilute hydrochloric acid and five 100 ml portions of water. After drying with anhydrous magnesium sulfate and filtering, the organic solvents were removed in vacuo. The residue weighing 12.07 g (99.7%) was of >98% purity by GLC analysis. H—NMR(CDCl₃): $\delta = 5.24$ (d. 2H. —CH₂—CF), 2.89 (q. 2H. —S—CH₂—), 1.30 (t. 3H,—CH₃).

Calcd for C₅H₇FN₂O₆S: C, 24.79; H, 2.91; F, 7.85; N, 55, 11.57; S, 13.24.

Found: C. 24.83; H. 2.96; F. 7.69; N. 11.68; S. 13.40.

EXAMPLE 3

bis(S-ethyl thiolcarbonate) of 2.2-dinitro-1.3-propandiol

To a stirred solution of 4.0 g (0.024 mol) of 2.2-dinitropropan-1.3-diol in 25 ml of methylene chloride/nitromethane 4/1 was added 5.8 ml ethyl chlorothiolformate and one ml of a solution of 50% ferric chloride in nitromethane. After an initial vigorous reaction, the solution was stirred for an additional 30 minutes at ambient temperature. The solution was taken up in methy- 5 lene chloride and washed with a 100 ml portion of dilute hydrochloric acid and five 100 ml portions of water. After drying and filtering, the solvent was removed in in vacuo at 0.05 torr. The residue weighed 8.3 g (100%). The purity of the residue was >98% by GLC analysis. 10 H-NMR (CDCl₃): $\delta=5.08$ (S, 4H, -O-CH₂-C(-NO₂)₂CH₂O-), 2.87 (d, 4H,-S-CH₂-), 1.29 (t, CH,-CH₃).

Calc. for C₉H₁₄N₂O₈S₂: C, 31.57; H, 4.12; N, 8.19; S, 18.73. Found: C, 31.76; H, 4.30; N, 8.06; S, 18.77.

EXAMPLE 4

2fluoro-2,2-dinitroethyl chloroformate

A solution of 13.82 g (0.057 mol) S-ethyl fluorodinitroethyl-thiolcarbonate in 50 ml of 1.2-dichloroethane and 25 20 ml of sulfuryl chloride was refluxed for 6 hours. After cooling, excess sulfuryl chloride and solvent was removed on a rotavac. The residue was distilled through a short column, 58° at 2 torr. To the yellowish distillate was added 2 ml cyclohexane and this was 30 redistilled to give 11.59 g (94%) of product. GLC analysis indicated a purity of 99%.

1.R. (film): $v_{max} = 1780$, 1605, 1310 cm⁻¹. H—NMR (CDCl₃): $\delta = 5.36$ (d. FC—CH₂—).

EXAMPLE 5

2.2.2-trinitroethyl chloroformate

To a solution of S-ethyl trinitroethylthiolcarbonate (27.85 g, 0.098 mol) in 50 ml of 1,2-dichloroethane was added 30 ml of sulfuryl chloride. The reaction solution was refluxed for six hours, cooled, and volatiles removed in vacuo. The residue was distilled through a short path column. 78° at 0.8 torr, to give 24.23 g of product. GLC analysis indicated a purity of 96.5%; corr. yield was 97.4%.

I.R. (film): $v_{max} = 1783$, 1608, 1300 cm⁻¹. H—NMR (CDCl₂): $\delta = 5.73$ (S. —CH₂—).

EXAMPLE 6

2.2-dinitropropyl chloroformate

A solution of S-ethyl 2.2-dinitropropylthiolearbonate 60 in 50 ml of 1.2-dichloroethane and 20 ml of sulfuryl chloride was refluxed for 6 hours. After cooling and removal of volatiles in vacuo the residue was distilled through a short path column to give 10.65 g (90%) of product; bp 82° at 0.2 torr.

1.R. (film): $v_{max} = 1779$, 1570, 1323 cm⁻¹ H—NMR (CDCl₃) $\delta = 5.08$ (S, 2H, —CH₂—), 2.25 (S, 3H,—CH₃).

EXAMPLE 7

1.3-bis(3,3,3-trinitroethyl carbonyldioxy)-2,2-dinitropropane

Pyridine (2.1 ml) was added to a slurry of 2,2-dinitro-propan-1,3-diol in 50 ml of CH_2Cl_2 at 10° C. After the diol had dissolved, a solution of trinitroethyl chloroformate (6.46 g, 26.6 mmol) in 7 ml of methylene chloride was added dropwise with stirring. The temperature was held below 15° during the addition. The solution was then stirred for 3.5 hours. Volatiles were then removed and the residue was washed with dilute hydrochloric acid and water and then air dried. The solid was recrystallized from methylene chloride to give 5.1 g of product (83%), m.p. 154°-5°.

H—NMR (acetone-d₆): δ=5.97 (S, 4H, CH₂C(NO₂)₃), 5.40 (S, 4H, CH₂) I.R. (fluorolube): $ν_{max}=1780$ cm⁻¹.

EXAMPLE 8

2,2-dinitropropyl-3.3.3-trinitroethylcarbonate

$$\begin{matrix} & & & & & & & \\ & & & & & & \\ CH_3C(NO_2)_2CH_2O - C - OCH_2C(NO_2)_3 \end{matrix}$$

To a solution of trinitroethyl chloroformate (6.46 g, 26.5 mmol) and 2.2-dinitropropanol (4.5 g, 30 mmol) in 35 25 ml of methylene chloride was added dropwise a solution of pyridine (2.24 ml) in methylene chloride (7 ml) at or below 5°. Then the solution was stirred for 3 hr at ice bath temperature and at ambient temperature for an additional hour. The solution was taken up in methylene chloride and washed consecutively with 100 ml of dilute hydrochloric acid and five 100 ml portions of water. The organic layer was dried (magnesium suifate), filtered, and the volatiles removed in vacuo. The solid residue was recrystalized from chloroform to give 45 5.68 g (60%) of product, m.p. 107°.

Calc. for C₆H₇N₅O₁₃: C, 20.18; H. 1.98; N, 19.61. Found: C, 19.87; H, 1.82; N, 19.85.

H—NMR(CDCl₃): δ = 5.47 (S, 2H, CH₂C(NO₂)₃), 5.04 (S, 2H, O—CH₂C (NO₂)₂—), 2.20 (S, 3H, —CH₃). I.R. (fluorolube mull): v_{max} = 1777 cm⁻¹.

EXAMPLE 9

2.2-dinitropropyl-3-fluoro-3.3-dinitroethylcarbonate

55

To a solution of dinitropropyl chloroformate (5.74 g, 0.027 mol) and fluorodinitroethanol (3.08 g, 0.02 mol) in 25 ml of methylene chloride at 4° was added with stirring a solution of pyridine (1.58 ml) in methylene chloride (9 ml). The rate of addition was controlled so that the temperature did not rise above 8°. After the addition was complete the reaction mixture was stirred for 3 hours at ice bath temperature and an additional 3 hours at ambient temperature. The reaction mixture was then transferred to a separatory funnel with 50 ml of methy-

lene chloride and washed consecutively with 100 ml of dilute hydrochloric acid and four 100 ml portions of water. The organic layer was dried (magnesium sulfate) filtered and the solvents removed in vacuo. The residue was crystallized from chloroform to give 6.0 g of prod- 5 uct, 91% based on fluorodinitroethanol, m.p. 66°.

Calc for C₆H₇FN₄O₁₁; C, 21.83; H, 2.14; F, 5.75; N

16.97. Found C. 21.98; H, 2.15; F, 6.00; N, 16.77. H—NMR (CDCl₃): δ =5.25 (d, 2H, CH₂—CF), 5.00 (S, 2H, CH₂C(NO₂)₂), 2.19 (S, 3H, —CH₃).

I.R. (fluorolube mull); $v_{max} = 1780 \text{ cm}^{-1}$.

Obviously, numerous modifications and variations of the present invention are possible in light of the above teachings. It is therefore to be understood that within the scope of the appended claims the invention may be practiced otherwise than as specifically described
